

NOSE ASSEMBLY DATA SHEET

Screw drawbolt adapter (10) onto head piston of tool one to two turns. Screw frame adapter (11) into front of head cylinder until drawbolt saddle comes into contact with the front of the frame. When installing the nose assembly rivet pintail may be inserted into the nose assembly to insure proper adjustment. For optimal installation, pintail should be engaged when inserted into the nose. Rotate nose assembly to desired position and tighten retaining nut on frame adapter assembly (11) securely. With tool connected to air insert a pintail into the jaws to set position.

Disassembly:

Remove frame adapter (11) providing access to drawbolt adapter (10). Remove drawbolt adapter, use wrench to loosen. Remove guard (5) and roll pin (8) allowing drawbolt and jaw assembly to be lifted out of frame (9). Remove dowel pin (2) and roll pin (3) and dismantle jaw assembly.

Assembly:

Reverse procedure. Insert spring (6) and jaw (4) into drawbolt (7). Place saddle (1) onto drawbolt and install dowel (2) and roll pin (3). Place drawbolt and jaw subassembly into frame (9) and install roll pin (8) and guard (5).

Use loctite #242 or equivalent when assembling drawbolt adapter and drawbolt, and when assembling frame adapter to frame.
